

# Why specify your space?

Our spaces influence almost every aspect of our lives. To protect your people and your project, how can you specify to maximise health and wellbeing?

## VALUE ENGINEERING → DESIGN DEVELOPMENT

Focus on value for money rather than price. Design development with a specialist manufacturer ensures risk-free, fit for purpose solutions that provide significant procurement and installation benefits.

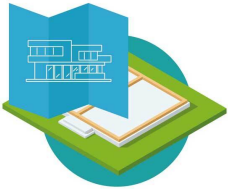

## APPROPRIATE MATERIAL SELECTION

A holistic system approach to the selection of materials and systems that are low maintenance and resource efficient, creating sustainable and risk-free healthy environments for our people and our planet.

## PEACE OF MIND

Specifying appropriate strategies for testing and compliance of solutions ensures products are suitable for the region and provides confidence to guarantee our living and working spaces are safe environments.

## EARLY ENGAGEMENT

Innovation happens in the early stages of a project. Mitigating issues upstream reduces the risk of failure downstream and often saves considerably more time and money.

## GOOD DETAILED DESIGN & TECHNICAL SPECIFICATIONS

Good detailed design goes hand in hand with specifications that help achieve the desired outcome. Drawings and technical specifications ensure quality control and buildability without compromise.
